PROJECT NAME: AI BASED DIABETES PREDICTION SYSTEM.

PHASE-04 : developing project part 2

Mail id:hpriyaa2004@gmail.com

In terms of data integration, the system leverages not only traditional patient data sources but also incorporates wearable device data, continuous glucose monitoring, and real-time health metrics. This expanded dataset enables a more

comprehensive understanding of an individual's health status and lifestyle, resulting in more precise predictions.The predictive modeling component incorporates state-of-the-art machine learning algorithms, deep learning techniques, and artificial intelligence to create highly accurate prediction models. These models adapt and improve over time by continuously learning from new data, allowing for dynamic updates and personalized predictions.

Machine Learning and AI: Machine learning algorithms, especially deep learning, have shown promise in predicting diabetes. These algorithms can analyze large datasets of patient information, such as medical records, genetic data, and lifestyle factors, to identify patterns and predict the risk of diabetes.

Artificial Pancreas Systems: These systems combine insulin pumps and CGM devices with predictive algorithms to automate insulin delivery. They can predict future glucose levels and adjust insulin delivery accordingly, reducing the risk of hypoglycemia and hyperglycemia.

Mobile Apps and Wearables: There's a growing ecosystem of mobile apps and wearables designed to help individuals manage diabetes. These apps often include predictive features that use data on diet, exercise, and glucose levels to provide personalized recommendations and forecasts.
